

RetryTech

Hey There, Warm wishes from Retry Tech

Hey there, We are happy to see you as our valuable customer of Bubbletok app. Here is the easy documentation to set the app ready to launch. Please follow all the instructions carefully and don't skip any step. Feel free to contact us if you face any problem while set-up. We are ready to help you.

Here is some quick steps to make this android app run on your server.

-Extract the android file and you will find one folder named Bubbletok_android. Launch the android studio and open that project by going to File -- Open and brows that folder and click **OK** and let the android studio do it's work and wait until project gets built completely. Make sure you are on high speed internet connection.

1- Connecting your app with admin panel

```
public interface Const {  
    String BASE_URL="http://yourDomain.com/api/";  
    String ITEM_BASE_URL="http://yourDomain.com/uploads/";  
}
```

Replace <yourDomain.com> with your domain name.

- Go to Java -- com -- retrytech -- vilo -- Utils -- and open Const file. and replace "yourDomain.com" with your Domain on both lines.

2- Making this app your own

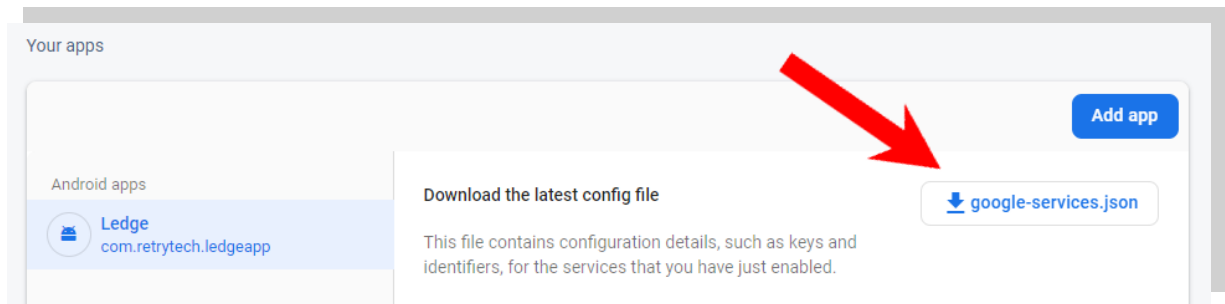

- After successful build, Go to the Java -- Com and expand that directory.
- Right Click on retrytech package and select Refactor -- Rename and then rename that package as you like.
- Then Right Click on vilo package and select Refactor -- Rename and then rename that package as you like.
- Now connect your android project with firebase by following this beautiful documentation provided by google.

Click Me

To know how to connect your project to firebase console
(Youtube video available)

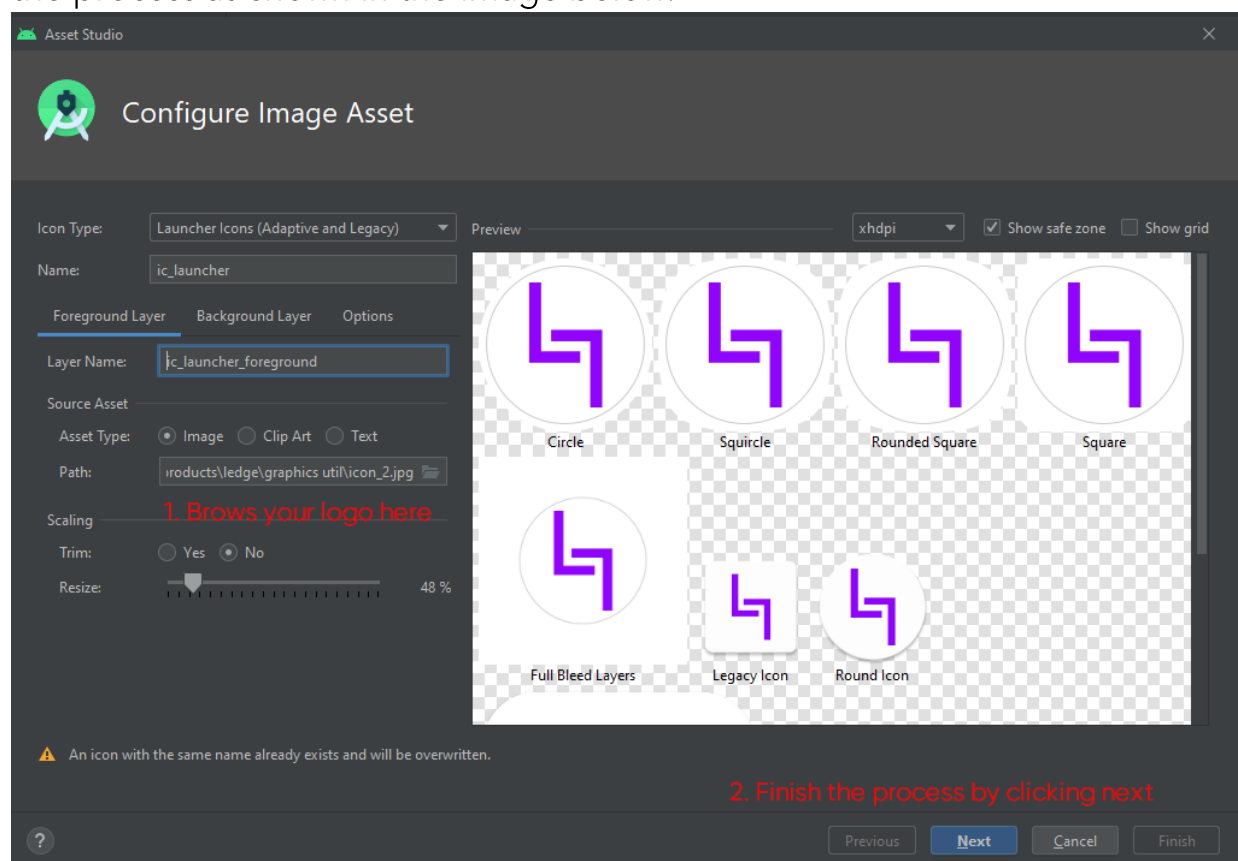

- After creating project successfully, go to the settings of your app and the download **google-services.json** file by clicking that button.

- Now open your project directory , go to **app** folder and paste that google-services.json file there in app folder. and rebuild your project.

3- Changing the app icon

- Go to **res** folder then Right click on mipmap folder then new and then click on **Image Asset** brows the path of your JPG or png file and finish the process as shown in the image below.

4- Changing the logo in whole app

- This is very easy process to change the app in whole logo of your app.

- Create 2 copies of your.png logo file and rename them with this three name and mind well that name should be same as I said.
1: logo_horizontal.png & 2: logo_horizontal_two.png

5- Changing the name of app

- Now go to your resources -- values and open **strings.xml** file and replace the app_name property with the name you want to keep of your name.

```
<!-- code created by RetryTech / Skype : RetryTech / Mail = retrytech@gmail.com -->

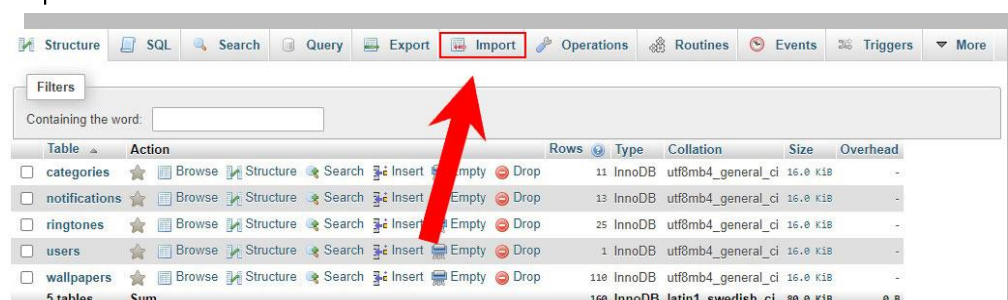

<string name="app_name">BubbleTok</string>
```

Admin Panel Settings

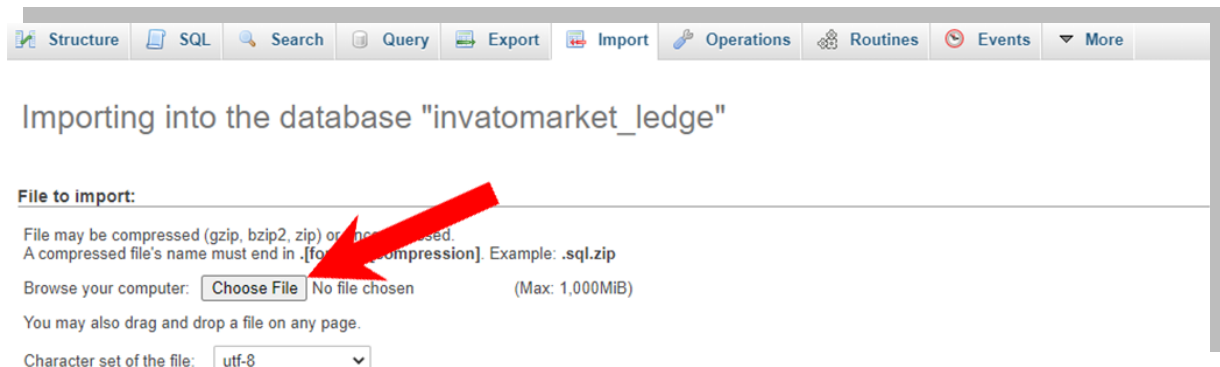

- Extract the .Zip file you downloaded from codecanyon
- Extract that folder using Winrar or any other software.
- There you will find a database.sql file.
- Then open your cpanel provided by your web hosting provider.(if not, contact us on **skype: RetryTech**)
- Click the MySQLDatabase option under DATABASES section and create database for your app.

- After that click the phpMyAdmin option under DATABASES section and the system will redirect you to the phpmyadmin console. there you will see just created database, click it and find the Import option on the top bar.

- Then click ChooseFile btn and load the database.sql file there you got from the Extraction of admin panel folder. And click the Go button at bottom of the page. Now Database is ready to use.

- Now come back to the folder where we extracted files and open the **bubbltok_admin** folder and go to the **includes** folder and open the **dp.php** file with any text editor you have.

```
k?php

$connection = mysqli_connect('localhost','DATABASE_USERNAME','DATABASE_PASSWORD','DATABASE_NAME');
if(!$connection){
    echo 'Not connected';
}else{

}

?>
```

- Replace some data there in that file given below and then save the file.

----- DATABASE_USERNAME = YOUR_DATABASE_USERNAME

----- DATABASE_PASSWORD = YOUR_DATABASE_PASSWORD

----- DATABASE_NAME = YOUR_DATABASE_NAME

- Now go to the targeted directory of your domain and then upload all the files from the **bubbltok_admin** folder to that directory on your server.

- Now you can access you admin panel on your domain and log in with these creadentials. You can change it anytme in your database.

After completing this much set-up, Contact us for the in-app purchase set-up (we do that at free of cost to help our valuable customers).

If you face any problem while setup the project you can contact us anytime. we are ready to solve your problems.
